

An `<svg>` element written straight into the HTML is drawn into the PDF as real vector artwork. Zoom in as far as you like: the edges stay sharp because there is no bitmap anywhere.

## ONE SHAPE, MANY COLOURS

#2563eb

#0d9488

#7c3aed

#f59e0b

#e11d48

#0f172a

## FOUR WAYS TO SET THE COLOUR

fill attribute

style="fill:..."

`<style>` inside the svg

currentColor

The page stylesheet does **not** reach inside an inline `<svg>`, so a rule such as `svg circle { fill: red }` in the page CSS is ignored. Colour the artwork from inside the SVG: presentation attributes, its own `style` attributes, a `<style>` element, or `currentColor` fed by a `color` attribute on the root.

## GRADIENTS

linearGradient

gradientTransform

radialGradient

three stops

## Gradient page furniture

background-image: url(brand-gradient.svg)

CSS gradient functions are not supported, but an SVG file used as a background image gives the same result, stretched with `background-size` and clipped by `border-radius`.

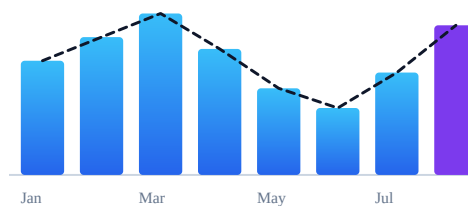

## CHARTS AS VECTOR ARTWORK

### Arrivals by market

|             |     |
|-------------|-----|
| Europe      | 42% |
| Asia        | 27% |
| Middle East | 18% |
| Americas    | 13% |

### Monthly bed nights

Bars share one gradient; the last one is recoloured with a plain fill .

## RECOLOURING FOR A DARK PANEL

**Raajje**  
reporting suite

light panel

**Raajje**  
reporting suite

dark panel, same markup, different colours

## AN ICON SET, DRAWN BY THE PDF ITSELF

home
